

Linux Hardening Audit Tool - Week 1 (Level 1) Update Report

Objective

Enhance the initial audit tool by adding system metadata, remediation suggestions, and report export capabilities.

Enhancements Implemented

- System Information Header (hostname, OS, kernel, timestamp)
- Remediation Suggestions for failed/warning checks
- JSON Report Export
- HTML Report Export

System Information Feature

The tool now displays system details before audit results, improving traceability and professionalism.

Remediation Suggestions

Each FAIL/WARN now includes actionable guidance, helping users fix security issues directly.

Report Export

The tool generates:

- audit_report.json (structured data)
- audit_report.html (visual report)

This aligns with real-world security tools.

Impact

The tool evolved from a simple script into a semi-professional audit utility with reporting and usability enhancements.

Conclusion

Week 1 updates significantly improved usability, reporting capability, and professional quality of the audit tool.
